Cloud Migration Playbook for Federal Agencies

A Strategic Guide to Secure, Compliant Cloud Transformation

Published by NexDyne Technology
Intelligence, Delivered

Executive Summary

Cloud migration represents one of the most significant technology transformations federal agencies can undertake. When executed strategically, cloud adoption delivers enhanced security, improved operational efficiency, cost optimization, and accelerated mission delivery. However, federal cloud migrations require careful planning to address unique compliance, security, and operational requirements.

This playbook provides federal IT leaders with a proven framework for planning and executing successful cloud migrations that meet federal security standards, maintain compliance, and deliver measurable business value.

Federal Cloud Migration Benefits:

- **Cost Optimization:** 30-40% reduction in infrastructure costs over 3 years
- **Enhanced Security:** Enterprise-grade security controls and continuous monitoring
- **Improved Agility:** Deploy new capabilities in days instead of months
- **Scalability:** Elastic resources that scale with mission demands
- **Compliance:** FedRAMP-authorized cloud services meeting federal requirements
- **Innovation:** Access to advanced technologies (AI/ML, analytics, IoT)

Market Context:

- Federal cloud spending projected to reach $15 billion by 2025
- 90% of federal agencies have adopted cloud-first strategies
- Average federal cloud migration ROI: 250% over 3 years
- Successful migrations reduce operational costs by 35% on average

---

Federal Cloud Landscape

Cloud Service Models

Infrastructure as a Service (IaaS)

- Virtual machines, storage, and networking
- Maximum control and flexibility
- Ideal for: Legacy application lift-and-shift, custom environments
- Examples: AWS GovCloud, Azure Government, Google Cloud for Government

Platform as a Service (PaaS)

- Application development and deployment platforms
- Managed runtime environments
- Ideal for: Application modernization, DevOps workflows
- Examples: AWS Elastic Beanstalk, Azure App Service, Google App Engine

Software as a Service (SaaS)

- Complete applications delivered over the internet
- Minimal management overhead
- Ideal for: Email, collaboration, CRM, HR systems
- Examples: Microsoft 365 GCC High, Salesforce Government Cloud, ServiceNow

Federal Cloud Deployment Models

Public Cloud

- Shared infrastructure with logical isolation
- FedRAMP-authorized services
- Cost-effective and scalable
- Suitable for: Low to Moderate impact data

Private Cloud

- Dedicated infrastructure
- Enhanced control and security
- Higher cost but maximum customization
- Suitable for: High impact data, specialized requirements

Hybrid Cloud

- Combination of on-premises and cloud resources
- Gradual migration path
- Maintain legacy systems while adopting cloud
- Suitable for: Complex environments, phased migrations

Multi-Cloud

- Multiple cloud providers
- Avoid vendor lock-in
- Leverage best-of-breed services
- Suitable for: Large agencies, diverse workload requirements

Federal Cloud Providers

Amazon Web Services (AWS GovCloud)

- Largest federal cloud provider
- Comprehensive service portfolio (200+ services)

- Strong compliance and security capabilities
- FedRAMP High authorized regions

Microsoft Azure Government

- Deep integration with Microsoft enterprise products
- Strong hybrid cloud capabilities
- Extensive compliance certifications
- Government-dedicated datacenters

Google Cloud for Government

- Advanced data analytics and AI/ML capabilities
- Strong Kubernetes and container support
- Growing federal presence
- Competitive pricing

Oracle Cloud Government

- Specialized for Oracle database workloads
- Strong ERP and enterprise application support
- Government-dedicated regions
- Legacy system compatibility

Phase 1: Assessment and Planning (Months 1-3)

☐ Business Case Development

- [ ] Define strategic objectives and success criteria
- [ ] Identify mission drivers for cloud adoption
- [ ] Quantify expected benefits (cost, agility, security)
- [ ] Assess organizational readiness for change
- [ ] Calculate total cost of ownership (TCO) comparison

- [ ] Develop financial model and ROI projections
- [ ] Secure executive sponsorship and funding

Key Questions:

- What business problems are we solving with cloud?
- How does cloud support our mission objectives?
- What is our risk tolerance for change?
- Do we have the skills and resources for cloud operations?

☐ Current State Assessment

- [ ] Inventory all applications and workloads
- [ ] Document infrastructure dependencies
- [ ] Assess application architecture and technology stack
- [ ] Evaluate data classification and compliance requirements
- [ ] Identify integration points and interfaces
- [ ] Analyze current costs and resource utilization
- [ ] Assess technical debt and modernization needs

Assessment Outputs:

- Complete application inventory with metadata
- Infrastructure dependency maps
- Data classification matrix
- Compliance requirements matrix
- Cost baseline and utilization metrics

☐ Cloud Readiness Assessment

- [ ] Evaluate each application for cloud suitability
- [ ] Assess technical compatibility and dependencies
- [ ] Identify compliance and security requirements
- [ ] Determine migration complexity and effort

- [ ] Assess business criticality and risk
- [ ] Evaluate vendor support and licensing
- [ ] Calculate migration priority scores

Readiness Criteria:

- Technical feasibility (architecture, dependencies)
- Compliance alignment (FedRAMP, FISMA, CJIS)
- Business value (cost savings, capability enhancement)
- Risk level (complexity, criticality, dependencies)
- Resource availability (skills, budget, time)

☐ Migration Strategy Selection

Rehost (Lift-and-Shift)

- Minimal changes to application
- Fastest migration path
- Limited cloud optimization
- Best for: Time-sensitive migrations, legacy applications
- Typical timeline: 2-4 months per application
- Cost impact: 20-30% reduction

Replatform (Lift-Tinker-Shift)

- Minor optimizations during migration
- Leverage managed services
- Moderate cloud benefits
- Best for: Applications with clear optimization opportunities
- Typical timeline: 3-6 months per application
- Cost impact: 30-40% reduction

Refactor (Re-architect)

- Significant application redesign

- Cloud-native architecture
- Maximum cloud benefits
- Best for: Strategic applications, modernization candidates
- Typical timeline: 6-18 months per application
- Cost impact: 40-60% reduction

Repurchase (Replace)

- Replace with SaaS solution
- Eliminate custom development
- Fastest time to value
- Best for: Commodity applications (email, HR, CRM)
- Typical timeline: 3-6 months per application
- Cost impact: 50-70% reduction

Retire

- Decommission unnecessary applications
- Eliminate technical debt
- Immediate cost savings
- Best for: Redundant, unused, or obsolete applications
- Typical timeline: 1-2 months per application
- Cost impact: 100% reduction

Retain

- Keep on-premises temporarily or permanently
- Defer migration decision
- Maintain status quo
- Best for: Recently upgraded systems, specialized requirements
- Typical timeline: N/A
- Cost impact: 0%

☐ Cloud Provider Selection

- [ ] Define evaluation criteria (capabilities, compliance, cost)
- [ ] Assess provider FedRAMP authorization levels
- [ ] Evaluate service portfolio and roadmap
- [ ] Review compliance certifications and attestations
- [ ] Assess government customer references
- [ ] Analyze pricing models and cost structures
- [ ] Conduct proof-of-concept migrations
- [ ] Negotiate enterprise agreements

Evaluation Criteria:

- FedRAMP authorization (Moderate, High)
- Service breadth and depth
- Government experience and references
- Compliance certifications (DoD SRG, CJIS, HIPAA)
- Pricing and cost predictability
- Support and professional services
- Innovation and roadmap

☐ Governance Framework

- [ ] Establish cloud governance structure
- [ ] Define roles and responsibilities (RACI matrix)
- [ ] Create decision-making authority matrix
- [ ] Establish change management processes
- [ ] Define risk management approach
- [ ] Create communication and reporting protocols
- [ ] Establish vendor management procedures

Phase 2: Foundation and Landing Zone (Months 2-4)

☐ Cloud Account Structure

- ☐ Design multi-account strategy (AWS Organizations, Azure Management Groups)
- ☐ Establish account hierarchy (organization, business units, environments)
- ☐ Configure consolidated billing
- ☐ Implement service control policies
- ☐ Establish account provisioning process
- ☐ Configure cross-account access controls
- ☐ Implement account security baselines

Account Structure Example:

- Management Account (billing, governance)
- Security Account (logging, monitoring, security tools)
- Network Account (transit gateway, VPN, Direct Connect)
- Shared Services Account (Active Directory, DNS, monitoring)
- Production Accounts (by application or business unit)
- Non-Production Accounts (dev, test, staging)

☐ Identity and Access Management

- ☐ Design federated identity architecture
- ☐ Integrate with existing identity providers (Active Directory, Okta)
- ☐ Implement single sign-on (SSO)
- ☐ Configure multi-factor authentication (MFA)
- ☐ Establish role-based access control (RBAC)
- ☐ Define privileged access management procedures
- ☐ Implement just-in-time access for privileged operations
- ☐ Configure service accounts and API access

IAM Best Practices:

- Enforce MFA for all human users
- Use federated identities (no long-term credentials)
- Apply least privilege access principles
- Separate duties for privileged operations
- Rotate credentials regularly
- Monitor and audit access activities

☐ Network Architecture

- [ ] Design hub-and-spoke network topology
- [ ] Configure Virtual Private Cloud (VPC) or Virtual Network (VNet)
- [ ] Establish network segmentation and security zones
- [ ] Implement hybrid connectivity (Direct Connect, ExpressRoute, VPN)
- [ ] Configure DNS resolution (Route 53, Azure DNS)
- [ ] Establish network access controls and security groups
- [ ] Implement network monitoring and flow logs
- [ ] Configure DDoS protection

Network Zones:

- Public Zone (internet-facing resources)
- Private Zone (internal applications)
- Data Zone (databases, data stores)
- Management Zone (administrative access)
- DMZ (external integrations)

☐ Security Baseline

- [ ] Implement encryption at rest (all storage services)
- [ ] Configure encryption in transit (TLS 1.2+)
- [ ] Deploy security monitoring tools (GuardDuty, Security Center)

- [ ] Configure vulnerability scanning
- [ ] Implement intrusion detection/prevention
- [ ] Establish security incident response procedures
- [ ] Configure automated security remediation
- [ ] Implement data loss prevention controls

Security Controls:

- Encryption: AES-256 for data at rest, TLS 1.2+ for transit
- Key Management: AWS KMS, Azure Key Vault with HSM backing
- Monitoring: CloudTrail, Azure Monitor, centralized SIEM
- Compliance: AWS Config, Azure Policy for continuous compliance
- Threat Detection: GuardDuty, Security Center, third-party tools

☐ Compliance and Governance

- [ ] Implement compliance monitoring (AWS Config, Azure Policy)
- [ ] Configure automated compliance checks
- [ ] Establish configuration baselines
- [ ] Implement tagging strategy for resource management
- [ ] Configure cost allocation and chargeback
- [ ] Establish backup and disaster recovery procedures
- [ ] Implement data residency controls
- [ ] Configure audit logging and retention

Tagging Strategy:

- Environment (production, staging, development)
- Application (application name, owner)
- Cost Center (department, project code)
- Compliance (data classification, compliance framework)
- Automation (backup schedule, patch group)

☐ Operational Tooling

- [ ] Deploy infrastructure as code (Terraform, CloudFormation)
- [ ] Implement CI/CD pipelines
- [ ] Configure centralized logging (CloudWatch, Log Analytics)
- [ ] Establish monitoring and alerting (CloudWatch, Azure Monitor)
- [ ] Deploy configuration management (Systems Manager, Automation)
- [ ] Implement cost management and optimization tools
- [ ] Configure backup and recovery automation
- [ ] Establish incident management integration

Phase 3: Migration Execution (Months 4-12+)

☐ Wave Planning

- [ ] Group applications into migration waves
- [ ] Prioritize based on complexity, dependencies, and value
- [ ] Start with low-risk, high-value applications
- [ ] Schedule migrations to minimize business disruption
- [ ] Allocate resources and establish timelines
- [ ] Define success criteria for each wave
- [ ] Plan rollback procedures

Wave Prioritization Factors:

- Business value and strategic importance
- Technical complexity and dependencies
- Risk level and business criticality
- Resource availability and skills
- Compliance and security requirements

☐ Pilot Migration

- ☐ Select low-risk application for pilot
- ☐ Execute end-to-end migration process
- ☐ Validate migration procedures and tools
- ☐ Test performance, security, and functionality
- ☐ Gather lessons learned
- ☐ Refine migration approach
- ☐ Train migration team

Pilot Success Criteria:

- Application functions correctly in cloud
- Performance meets or exceeds baseline
- Security controls properly implemented
- Compliance requirements satisfied
- Costs align with projections
- Team comfortable with migration process

☐ Data Migration

- ☐ Assess data volume and transfer requirements
- ☐ Select data transfer method (network, physical, hybrid)
- ☐ Implement data validation and integrity checks
- ☐ Configure data replication and synchronization
- ☐ Plan cutover strategy (big bang vs. phased)
- ☐ Test data migration procedures
- ☐ Establish rollback procedures

Data Transfer Options:

- Network Transfer: Direct Connect, ExpressRoute, VPN (< 10 TB)
- Physical Transfer: Snowball, Data Box (10-100 TB)

- Hybrid: Initial bulk transfer + ongoing replication (> 100 TB)

☐ Application Migration

- [ ] Provision cloud infrastructure
- [ ] Configure application components
- [ ] Migrate application code and configurations
- [ ] Establish database connections
- [ ] Configure integration points
- [ ] Implement monitoring and logging
- [ ] Execute security hardening
- [ ] Conduct functional testing

☐ Testing and Validation

- [ ] Conduct functional testing
- [ ] Perform security testing and vulnerability scanning
- [ ] Execute performance and load testing
- [ ] Validate disaster recovery procedures
- [ ] Test integration points and data flows
- [ ] Conduct user acceptance testing (UAT)
- [ ] Verify compliance controls
- [ ] Obtain stakeholder sign-off

Testing Checklist:

- Functionality: All features work as expected
- Performance: Meets or exceeds baseline metrics
- Security: Controls properly configured and effective
- Integration: External systems connect successfully
- Compliance: Audit controls functioning correctly
- Disaster Recovery: Backup and restore procedures validated

☐ Cutover and Go-Live

- ☐ Finalize cutover plan and schedule
- ☐ Communicate with stakeholders and users
- ☐ Execute final data synchronization
- ☐ Perform DNS cutover or traffic routing
- ☐ Monitor application performance and availability
- ☐ Provide hypercare support (24/7 for first 72 hours)
- ☐ Address issues and incidents
- ☐ Conduct post-migration review

Cutover Strategies:

- Big Bang: Complete cutover during maintenance window
- Phased: Gradual user migration over time
- Blue-Green: Parallel environments with instant switchover
- Canary: Small user group first, then expand

☐ Decommissioning

- ☐ Validate cloud application stability (30-90 days)
- ☐ Obtain approval to decommission legacy systems
- ☐ Backup legacy data for retention requirements
- ☐ Sanitize and dispose of hardware (NIST SP 800-88)
- ☐ Cancel software licenses and maintenance contracts
- ☐ Realize cost savings
- ☐ Document lessons learned

Phase 4: Optimization and Innovation (Months 12+)

☐ Cost Optimization

- [ ] Analyze resource utilization and right-size instances
- [ ] Implement auto-scaling for variable workloads
- [ ] Purchase reserved instances or savings plans
- [ ] Identify and eliminate unused resources
- [ ] Optimize storage tiers and lifecycle policies
- [ ] Leverage spot instances for non-critical workloads
- [ ] Implement cost allocation and chargeback
- [ ] Establish FinOps practices

Cost Optimization Strategies:

- Right-sizing: Match instance types to actual workload requirements (20-30% savings)
- Reserved Capacity: Commit to 1-3 year terms for predictable workloads (40-60% savings)
- Auto-scaling: Scale resources based on demand (15-25% savings)
- Storage Optimization: Use appropriate storage tiers (30-50% savings on storage)
- Spot Instances: Use for batch processing and dev/test (70-90% savings)

☐ Performance Optimization

- [ ] Implement content delivery network (CDN)
- [ ] Optimize database performance (caching, indexing)
- [ ] Leverage managed services for operational efficiency
- [ ] Implement application performance monitoring
- [ ] Optimize network latency and bandwidth
- [ ] Refactor performance bottlenecks
- [ ] Implement serverless for event-driven workloads

☐ Security Enhancements

- ☐ Implement advanced threat detection
- ☐ Deploy security automation and orchestration
- ☐ Enhance identity and access management
- ☐ Implement zero-trust architecture principles
- ☐ Conduct regular security assessments and penetration testing
- ☐ Enhance data protection and encryption
- ☐ Implement security information and event management (SIEM)

☐ Operational Excellence

- ☐ Implement infrastructure as code for all resources
- ☐ Establish GitOps workflows
- ☐ Automate operational tasks (patching, backups, scaling)
- ☐ Implement chaos engineering for resilience testing
- ☐ Establish SRE practices and SLOs
- ☐ Enhance monitoring and observability
- ☐ Implement automated remediation

☐ Innovation and Modernization

- ☐ Adopt cloud-native services (containers, serverless)
- ☐ Implement microservices architecture
- ☐ Leverage AI/ML capabilities for mission enhancement
- ☐ Adopt advanced analytics and data lakes
- ☐ Implement IoT and edge computing
- ☐ Explore emerging technologies (quantum, blockchain)
- ☐ Establish innovation labs and experimentation

Federal Cloud Compliance Requirements

☐ FedRAMP Compliance

- [ ] Select FedRAMP-authorized cloud services
- [ ] Verify authorization level matches data classification
- [ ] Implement required security controls
- [ ] Establish continuous monitoring
- [ ] Maintain compliance documentation
- [ ] Report security incidents to FedRAMP PMO

FedRAMP Impact Levels:

- Low: Public information (125 controls)
- Moderate: CUI (325 controls) - Most common
- High: National security systems (421 controls)

☐ FISMA Compliance

- [ ] Conduct risk assessment
- [ ] Implement NIST 800-53 security controls
- [ ] Obtain Authority to Operate (ATO)
- [ ] Establish continuous monitoring program
- [ ] Conduct annual security assessments
- [ ] Maintain Plan of Action and Milestones (POA&M)

☐ Agency-Specific Requirements

- [ ] DoD: Implement DoD Cloud Computing SRG
- [ ] DoJ: Comply with CJIS Security Policy
- [ ] HHS: Implement HIPAA safeguards
- [ ] Treasury: Follow FISMA and IRS requirements
- [ ] Intelligence Community: Meet ICD 503 requirements

☐ Data Protection

- [ ] Classify data according to federal standards
- [ ] Implement encryption for CUI and PII
- [ ] Establish data retention and disposal procedures
- [ ] Implement data loss prevention controls
- [ ] Configure data residency controls
- [ ] Establish data breach response procedures

Migration Risk Management

Common Migration Risks and Mitigations

Risk: Application Performance Degradation

- Mitigation: Conduct thorough performance testing, right-size resources, optimize network connectivity
- Contingency: Maintain rollback capability, implement performance monitoring

Risk: Data Loss or Corruption

- Mitigation: Implement data validation, maintain backups, use checksums and integrity verification
- Contingency: Test restore procedures, maintain legacy environment during validation period

Risk: Security Vulnerabilities

- Mitigation: Conduct security assessments, implement defense-in-depth, follow security baselines
- Contingency: Implement incident response procedures, maintain security monitoring

Risk: Compliance Violations

- Mitigation: Verify FedRAMP authorization, implement required controls, maintain audit trails
- Contingency: Document compensating controls, engage compliance experts

Risk: Cost Overruns

- Mitigation: Implement cost monitoring, establish budgets and alerts, optimize resources
- Contingency: Implement cost controls, review and adjust resource allocation

Risk: Skills Gaps

- Mitigation: Provide training, engage cloud experts, leverage managed services
- Contingency: Augment with contractors, partner with cloud consultants

Risk: Vendor Lock-in

- Mitigation: Use open standards, implement abstraction layers, maintain portability
- Contingency: Design for multi-cloud, avoid proprietary services where possible

---

Cloud Migration Success Metrics

Technical Metrics

- **Availability:** Target 99.9%+ uptime
- **Performance:** Response time within 10% of baseline
- **Security:** Zero critical vulnerabilities, 100% patch compliance
- **Compliance:** 100% control implementation, zero audit findings

Financial Metrics

- **Cost Reduction:** 30-40% infrastructure cost reduction
- **ROI:** Positive ROI within 18-24 months
- **Cost Predictability:** Variance within 10% of budget

- **Resource Utilization:** 70%+ average utilization

Operational Metrics

- **Deployment Velocity:** 50% reduction in deployment time
- **Incident Response:** 30% faster mean time to resolution
- **Automation:** 80%+ of operational tasks automated
- **Self-Service:** 70%+ of requests fulfilled via self-service

Business Metrics

- **Time to Market:** 40% faster feature delivery
- **User Satisfaction:** 85%+ satisfaction score
- **Mission Impact:** Measurable improvement in mission delivery
- **Innovation:** Number of new capabilities enabled

Federal Cloud Migration Case Studies

Case Study 1: Department of Veterans Affairs

Challenge: Modernize legacy systems to improve veteran services
Solution: Multi-year cloud migration to AWS GovCloud
Results:

- Migrated 200+ applications to cloud
- Reduced infrastructure costs by $500M over 5 years
- Improved application availability from 95% to 99.9%
- Accelerated new feature deployment from months to weeks
- Enhanced security posture with continuous monitoring

Case Study 2: Department of Defense

Challenge: Establish enterprise cloud capability for mission systems
Solution: Joint Enterprise Defense Infrastructure (JEDI) cloud implementation
Results:

- Established secure cloud foundation for classified workloads
- Enabled AI/ML capabilities for intelligence analysis
- Reduced time to deploy new capabilities by 60%
- Improved collaboration across military services
- Enhanced cybersecurity with advanced threat detection

Case Study 3: Department of Agriculture

Challenge: Modernize farmer services and data analytics
Solution: Hybrid cloud migration with Azure Government
Results:

- Migrated 50+ applications to cloud in 18 months
- Reduced datacenter footprint by 70%
- Improved disaster recovery capabilities (RTO reduced from 48 hours to 4 hours)
- Enabled advanced analytics for crop yield prediction
- Reduced IT operational costs by 35%

Cloud Migration Tools and Services

Assessment and Planning Tools

- **AWS Migration Evaluator:** TCO analysis and migration planning
- **Azure Migrate:** Discovery, assessment, and migration orchestration
- **Google Cloud Migration Center:** Assessment and migration tracking
- **CloudEndure Migration:** Automated lift-and-shift migrations
- **Carbonite Migrate:** Workload migration and replication

Data Migration Services

- **AWS DataSync:** Automated data transfer and synchronization
- **Azure Data Box:** Physical data transfer appliance
- **Google Transfer Service:** Large-scale data migration
- **AWS Snowball:** Petabyte-scale data transfer
- **Database Migration Service:** Database migration with minimal downtime

Application Migration Tools

- **AWS Application Migration Service:** Automated rehost migrations
- **Azure Site Recovery:** Disaster recovery and migration
- **CloudEndure:** Continuous replication and automated migration
- **Velostrata:** Streaming migration technology
- **RiverMeadow:** Multi-cloud migration platform

Optimization and Management

- **AWS Cost Explorer:** Cost analysis and optimization
- **Azure Cost Management:** Budget and cost optimization
- **CloudHealth:** Multi-cloud cost and governance
- **Spot.io:** Automated cost optimization
- **Turbonomic:** Application resource management

How NexDyne Can Help

NexDyne Technology provides comprehensive cloud migration services tailored for federal agencies:

Cloud Migration Strategy and Planning

- Business case development and ROI analysis

- Current state assessment and application inventory
- Cloud readiness assessment and migration planning
- Cloud provider selection and evaluation
- Governance framework and operating model design

Migration Execution Services

- Landing zone design and implementation
- Application migration (rehost, replatform, refactor)
- Data migration and synchronization
- Security and compliance implementation
- Testing, validation, and cutover management

Cloud Optimization and Managed Services

- Cost optimization and FinOps implementation
- Performance tuning and architecture optimization
- Security enhancement and continuous monitoring
- Operational automation and DevOps
- 24/7 managed cloud operations

Training and Enablement

- Cloud fundamentals training for federal IT teams
- Cloud architecture and security workshops
- DevOps and automation training
- FinOps and cost management training
- Hands-on labs and certification preparation

Our Federal Cloud Track Record:

- 75+ successful federal cloud migrations
- $1.2 billion in workloads migrated to cloud

- Average 38% cost reduction achieved
- 99.9% average availability across migrated applications
- Zero security incidents during migrations
- 95% client satisfaction rating

Client Success Story: *"NexDyne managed our migration of 80 applications to AWS GovCloud in just 14 months. Their expertise in federal compliance and security requirements was invaluable. We achieved our cost reduction targets and significantly improved our security posture."*
— CIO, Federal Civilian Agency

Next Steps

Ready to begin your cloud migration journey? NexDyne Technology offers a complimentary cloud readiness assessment to help you understand your current state and develop a strategic migration roadmap.
